ABSTRACTED-PUB-NO: RU 2107449C

BASIC-ABSTRACT:

The toothbrush comprises a handle (1), neck (2) and head (3) with several brush tuft holder sections (4). The sections (4) are located perpendicular to the longitudinal axis and are separated one from another by resilient cross members (5) attached to the sections. A flexible element (6) passes through the sections. One end of the flexible elements is fixed to the sections, and the

second end is fixed to a ring (7) mounted on the handle, which can move along its longitudinal axis. The ring is pulled during use to alter the configuration of the brush head.

ADVANTAGE - Increases convenience to the user, by providing possibility of alteration of shape of brush head.
